

# СУПЕР С-ТАУ ФАБРИКА: ДЕТЕКТОР

---

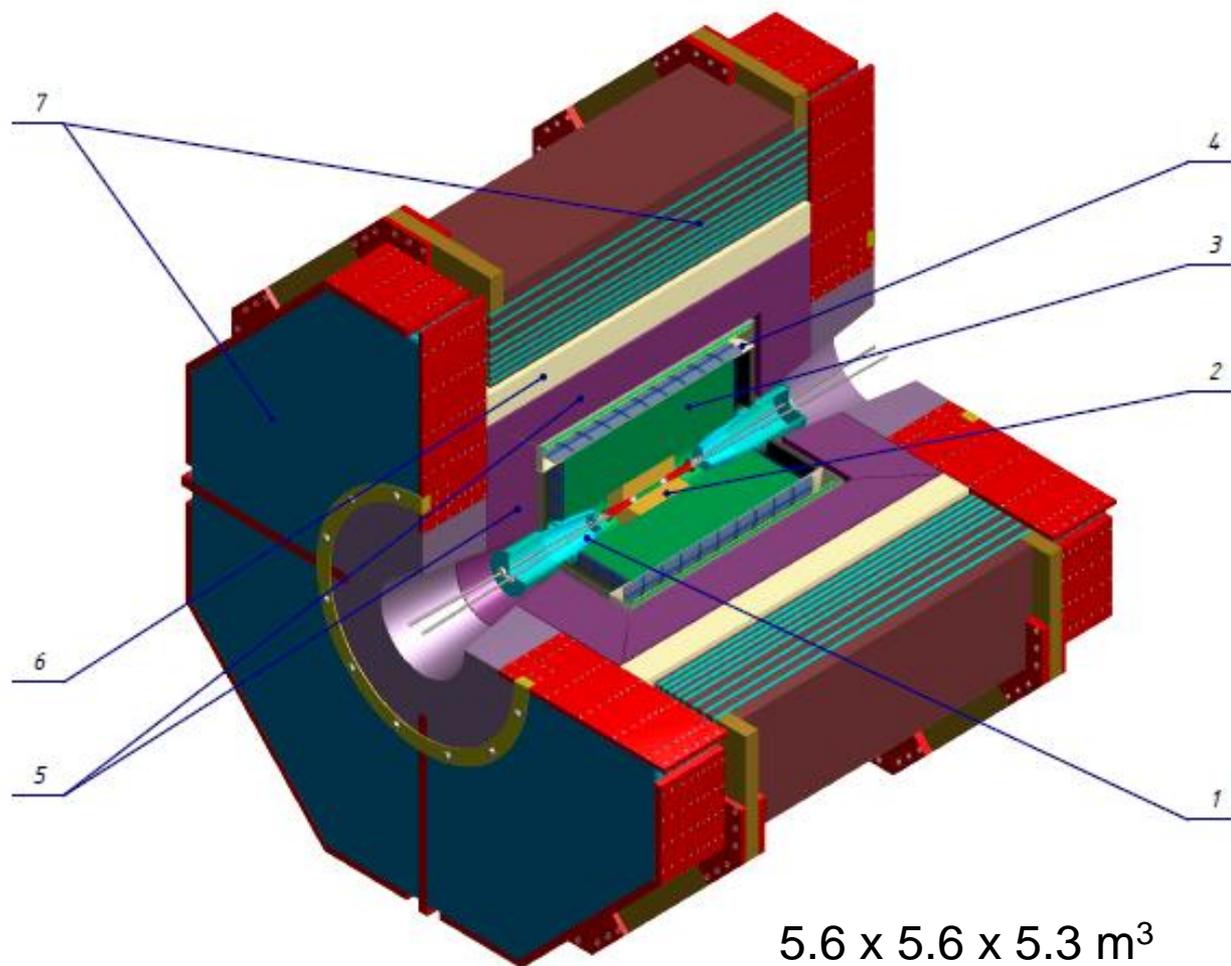

Иван Логашенко

*ИЯФ СО РАН*

# Требования к детектору

- Momentum resolution  $\sigma_p/p \leq 0.4\%$  at 1 GeV
- Very symmetric and hermetic
- Able to detect soft tracks ( $p_t \geq 50 \text{ MeV}/c$ )
  - Inner tracker should be able to handle  $10^4$  tracks/cm<sup>2</sup>s
- Very good particle identification:  $e/\mu/\pi/K$ 
  - $\pi/K$  in the whole energy range, e.g. for  $D\bar{D}$  mixing
  - $\mu/\pi$  up to 1.5 GeV, e.g. for  $\tau \rightarrow \mu\gamma$  search
  - $dE/dx$  better than 7%
- Able to detect  $\gamma$  from 10 MeV to 3.5 GeV, good  $\pi^0/\gamma$  separation
  - Calorimeter energy resolution  $\sigma_E/E \leq 1.8\%$  at 1 GeV
  - Calorimeter time resolution  $\sigma_t \leq 1 \text{ ns}$
- Efficient “soft” trigger
- Ability to operate at high luminosity, up to 300 kHz at  $J/\psi$

# Общая структура

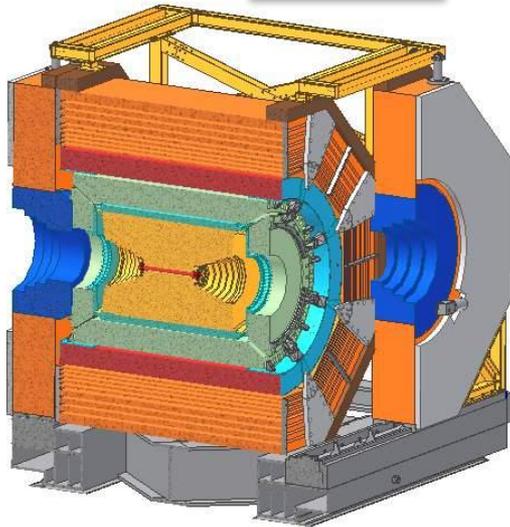

1. Vacuum pipe
2. Inner tracker
3. Drift chamber
4. PID
5. Calorimeter
6. SC magnet
7. Muon system

5.6 x 5.6 x 5.3 m<sup>3</sup>

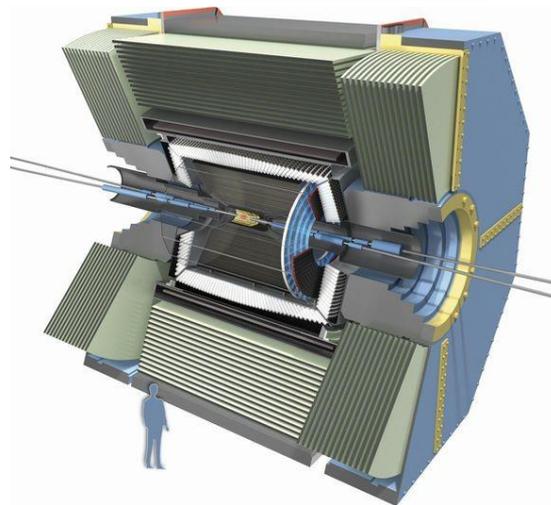

# Brothers, sisters and cousins...

BES-3

BELLE

BaBar

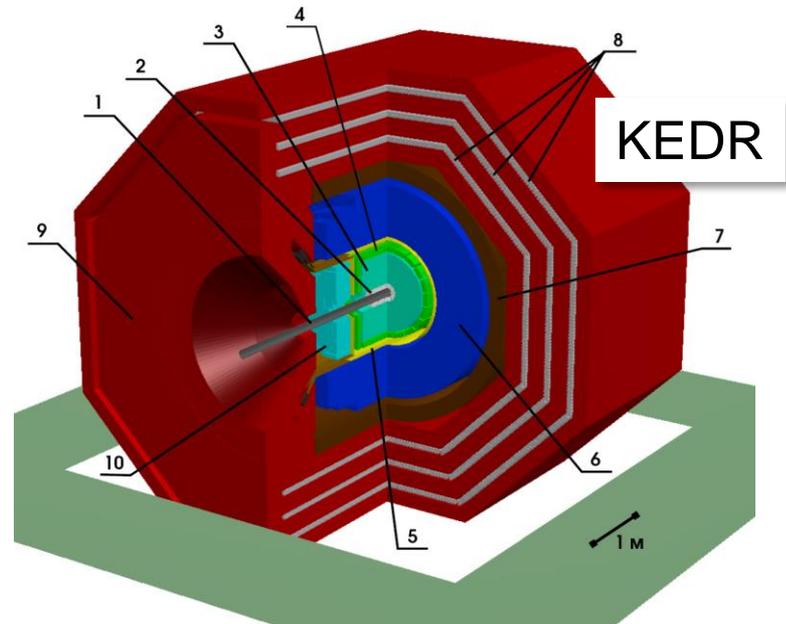

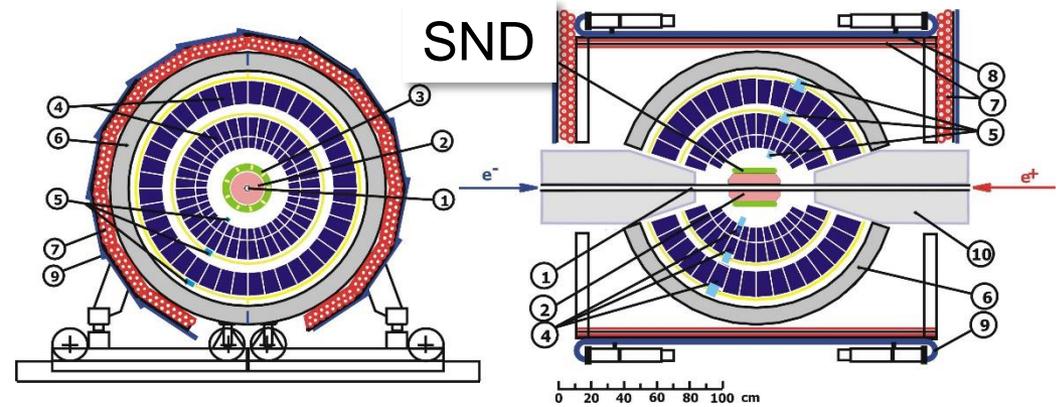

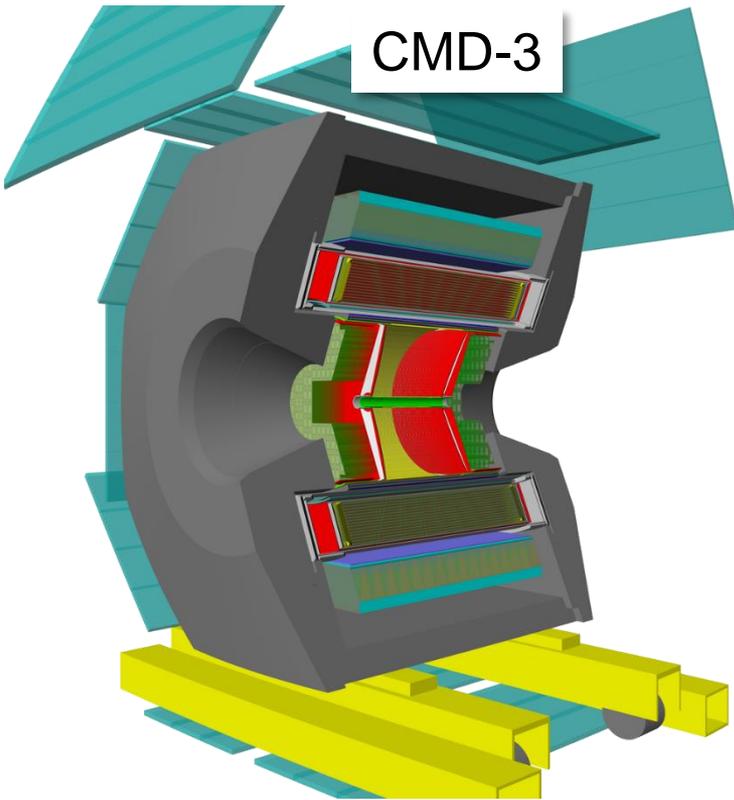

CLEO-c

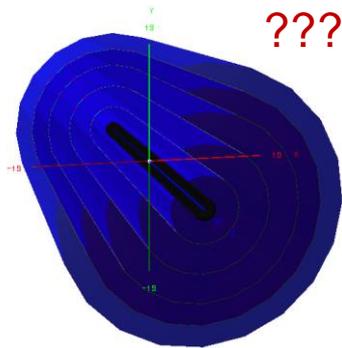

# In-house (Novosibirsk) cousins

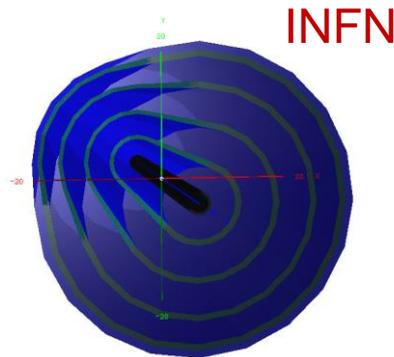

CMD-3

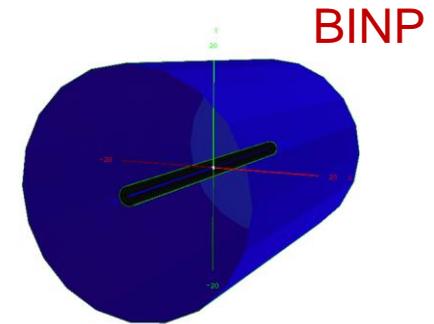

# Внутренний трекер

4-layer Si-strip

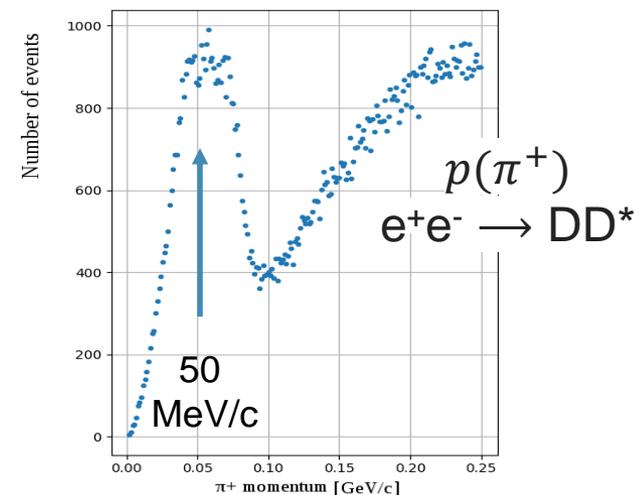

Cylindrical MPGD

Time Projection Chamber (TPC)

- Работает как независимая система (треки, не вылетающие в ЦДК), так и совместно с ЦДК
- Измеряет параметры треков и координаты вершин распадов
- Разрешение сравнимо с ЦДК ( $\sim 100 \mu$ )
- Способна регистрировать «мягкие» частицы ( $p_t \sim 50 \text{ MeV}/c$ )
- Способная работать в условиях большой загрузки
- Приблизительные размеры:  
 $\varnothing (40-400) \times 600 \text{ мм}$

# Inner Tracker: TPC

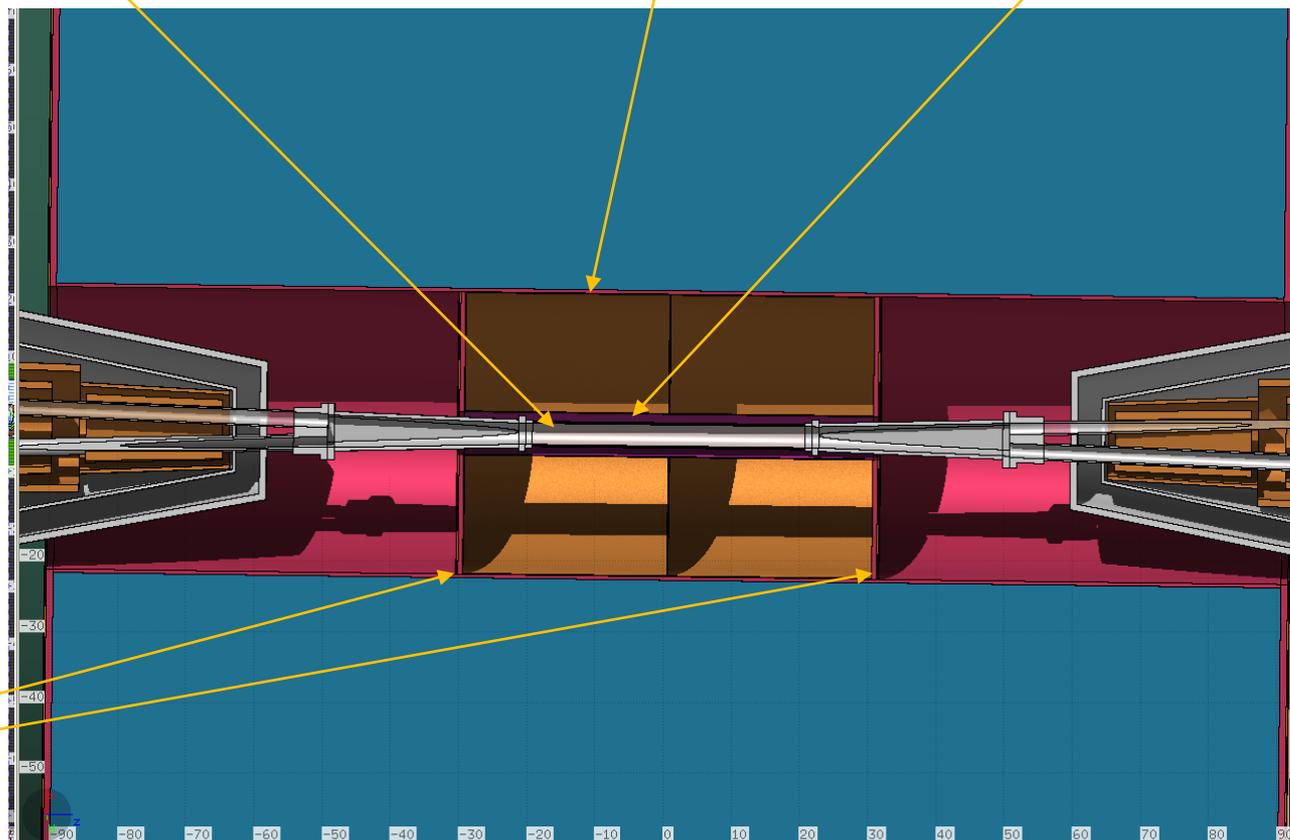

Beam pipe, inner radius 1.5 cm

Outer radius 20 cm

Inner radius 3 cm

TPC advantages:

- Highest number of hits per track
- Great  $dE/dx$  measurement

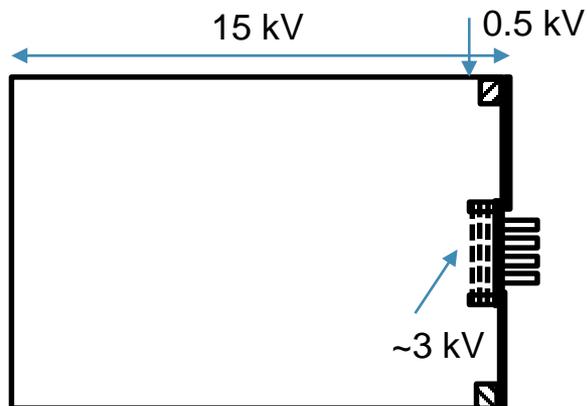

$-30 \text{ cm} < Z < 30 \text{ cm}$

# TPC prototype

Ability to operate in high flux (including reconstruction) have to proved

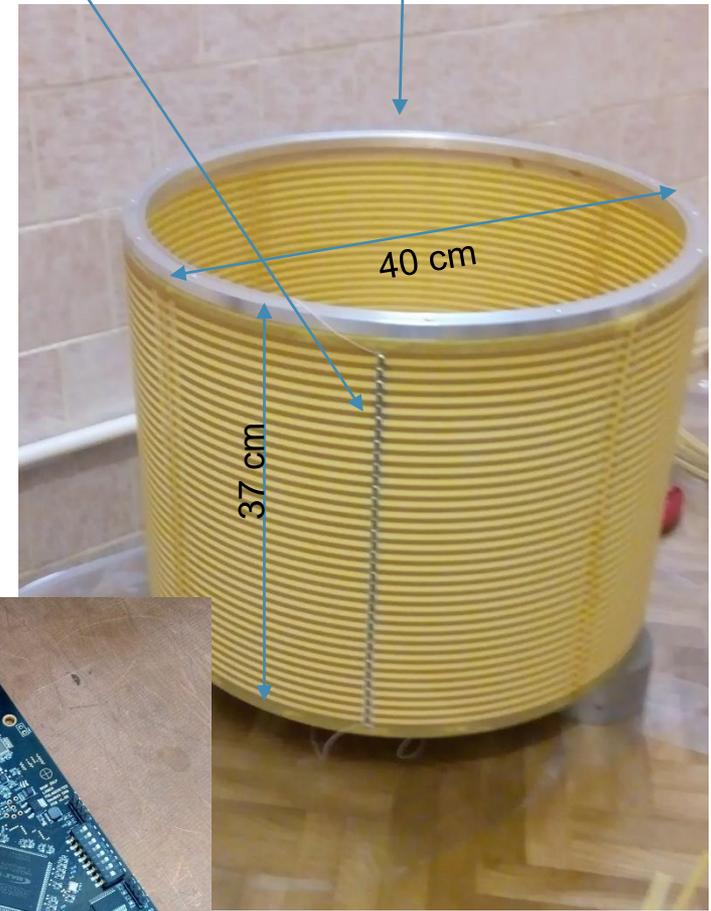

Field cage is ready. Design of the end-cap detector is going on.

- Quad-GEMs, then 2(3)GEMs-  
muRWELL
- Readout structure with several groups of pads with different size 1-4 mm
- Electronics based on DMXG64B ASIC (CSA+100 cells of analogue memory)

Resistive divider

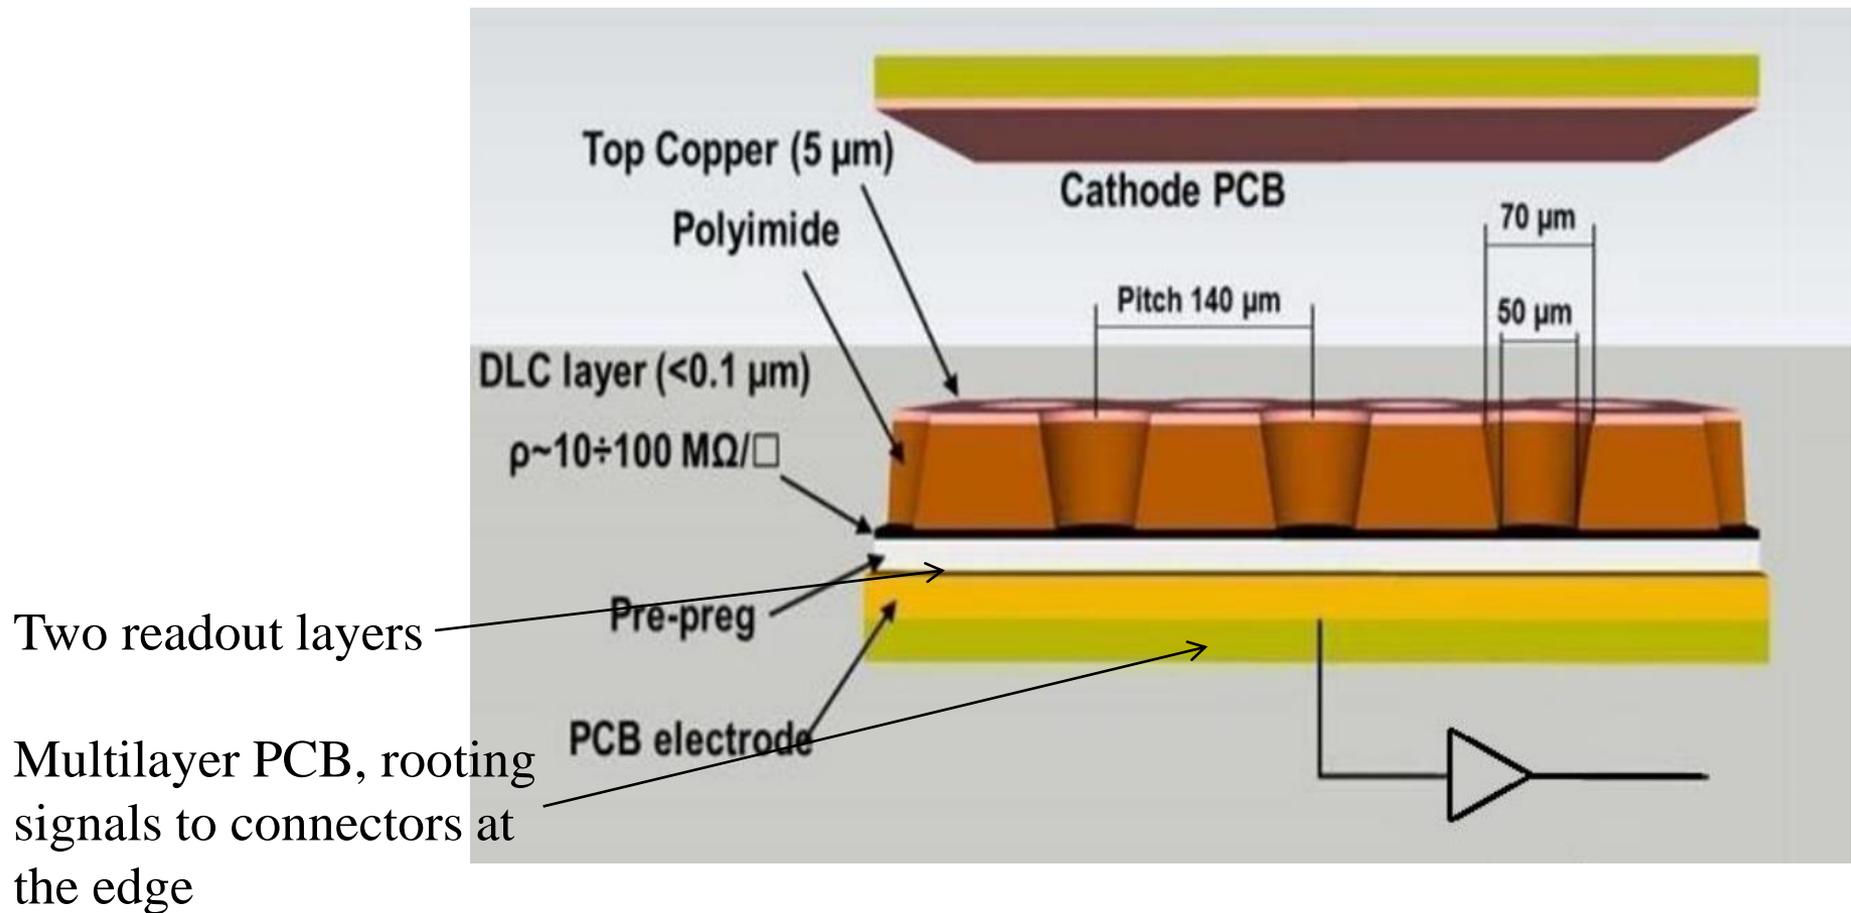

Flange for the end-cap detector

128-channel board

# Resistive micro-WELL

GEM on top of resistive layer and on top of readout PCB

# Inner Tracker: C-mRWELL

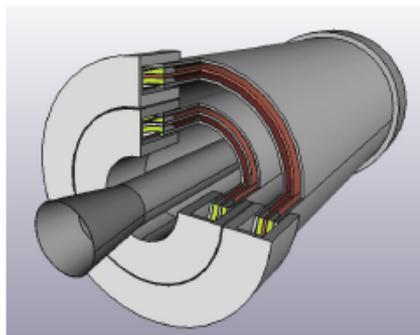

## The Cylindrical u-RWELL

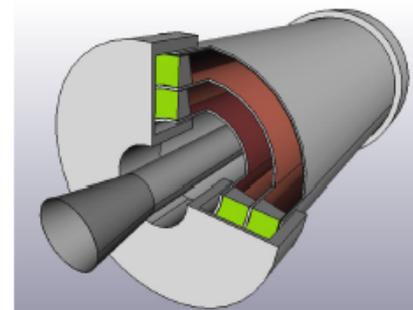

The **two schemes** under study are both based on a **B2B layout** (a **double radial TPC** – with a **central cathode**), characterized by **low material budget** and **modular roof-tile shaped active device**

**“2 - B2B small drift gap” cylindrical detector**

**“1 - B2B large drift gap” cylindrical detector**

micro-TPC readout mode allowing space resolution of  $O(100 \mu\text{m})$  for inclined tracks (on the radial view)

**N.2 small gap B2B C+layers** → **1.72% X0**  
 2 × 1 cm gas gap/B2B device  
 4 cm global sampling gas

• **N.1 large gap B2B C+layers** → **0.86% X0**  
 • 2 × 1 cm gas gap/B2B device  
 10 cm global sampling gas

**1.46 % X0**

Further **material budget reduction** by using:

- high module FR4
- low resistivity DLC cathode
- aluminum Faraday-Cage/shielding

**0.75 % X0**

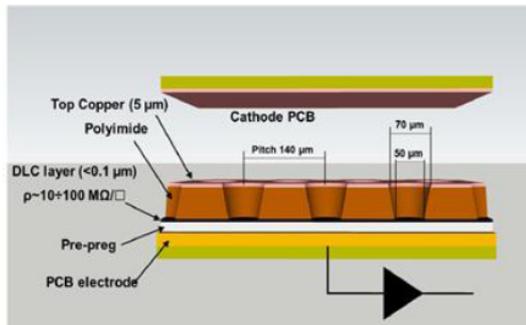

# C-mRWELL prototype

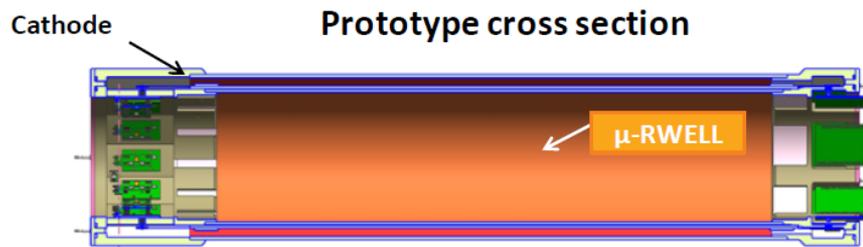

## The C+RWELL prototype

To validate the concept we are designing a single-layer small drift-gap (1 cm) C+RWELL prototype

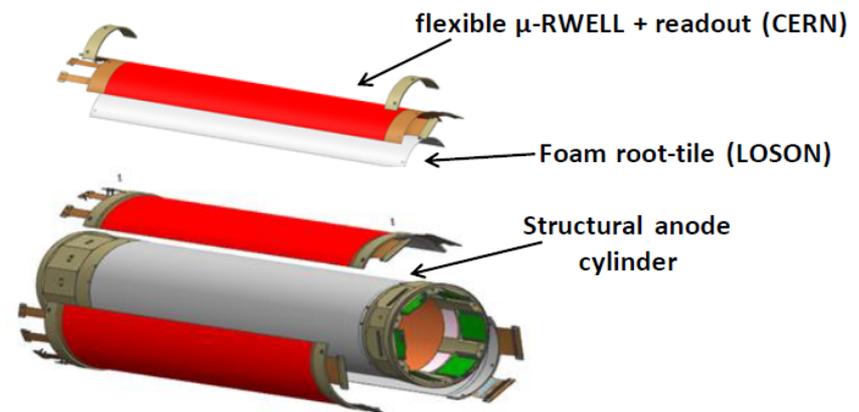

- From standard **micro-RWELL technology on rigid PCB supports** we are developing a **full flexible detector tile**
- **Three of such flexible detector tiles** will be **glued on composite/foam roof-tiles**, then mounted on the **anode cylindrical support**
- **A full cylindrical-cathode** will close (externally) the detector

### Prototype size

- external diameter  $\approx 20\text{cm}$
- global length  $\approx 100\text{cm}$
- active length  $\approx 60\text{cm}$

# C-mRWELL prototype

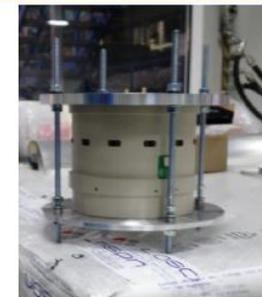

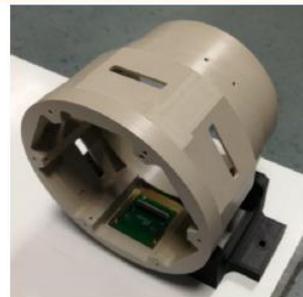

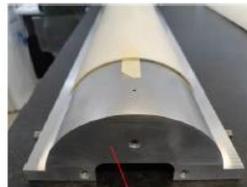

Cremlin+ → the C+RWELL progress (II)

The **design** of the prototype has been **completely revised and finalized**

- Orders of **flex-detector tiles** (CERN – Rui) done → delivery by the end of November
- Orders of **mechanics/tools** (anode/cathode, end-caps, plugs, tiles) done → **construction in progress (@LOSON):**
- **anode mould** **DONE**
- **cathode mould** **DONE**
- **end-caps/plugs in peek** → **DONE**
- **tiles (still) under test** → **DONE**
- **HV, signal interface boards** → **DONE**
- **Detector assembly** → **Nov – Dec 2021**

# Центральная дрейфовая камера

Measurement of momentum and  $dE/dx$  (PID)

- Spatial resolution  $\sim 100 \mu$
- Small cell
- Minimal material (reduce MS)
- Approximate size:  $\emptyset$  (400-1600) x 1800 mm

---

**“Traditional” option BINP**

Babar, BES-3, Belle-2

Axial and stereo superlayers

Traditional  $dE/dx$

Feed-through wiring

---

**“Beyond-traditional” option INFN**

KLOE, MEG-2, IDEA

Full stereo

$dE/dx$  by cluster counting

Robotic wiring

---

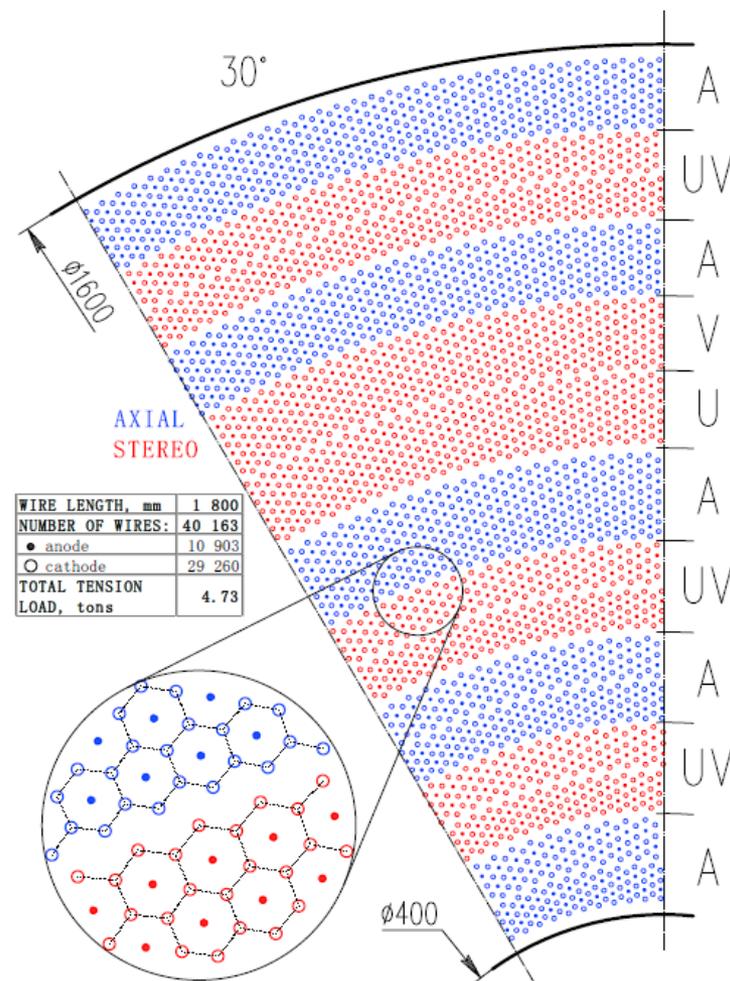

# Drift chamber: “traditional” option (BINP)

- ~40000 wires
  - 11k sensitive, W-Rh(Au)
  - 29k field, Al(Au)
- Hexagonal cell, 6.3-7.5 mm
- 41 layers
- 60% He + 40% C<sub>3</sub>H<sub>8</sub>
- 330 ns drift time (1.5 T)

$$\frac{\sigma_{p_t}}{p_t} \approx \sqrt{0.21\%^2 p_t^2 + 0.31\%^2}$$

≈ 0.4% at 1 GeV

$$\frac{\sigma_{dE/dx}}{dE/dx} \approx 6.9\%$$

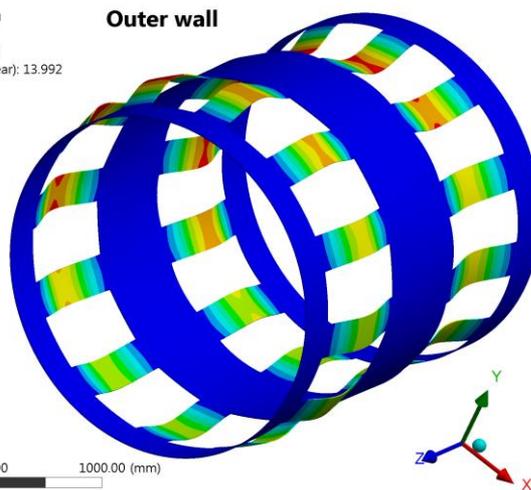

# Drift chamber: “traditional” option (BINP)

## R: Eigenvalue Buckling

# Drift chamber: TraPid option (INFN)

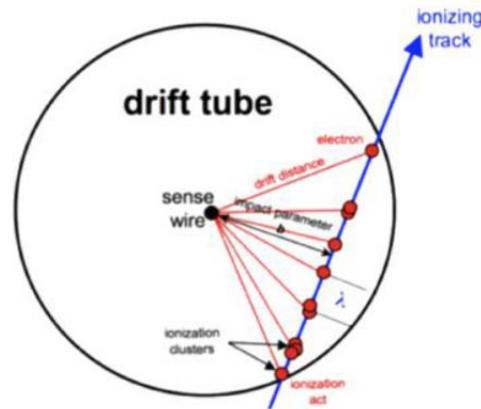

- ~141000 wires
  - 23k sensitive, W
  - 117k field, Al ( $\rightarrow$  C)
- Square cell, 7.2-9.1 mm
- 64 layers
- 90% He + 10% iC<sub>4</sub>H<sub>10</sub>

$$\frac{\sigma_{p_t}}{p_t} \approx \sqrt{0.078\%^2 p_t^2 + 0.18\%^2}$$

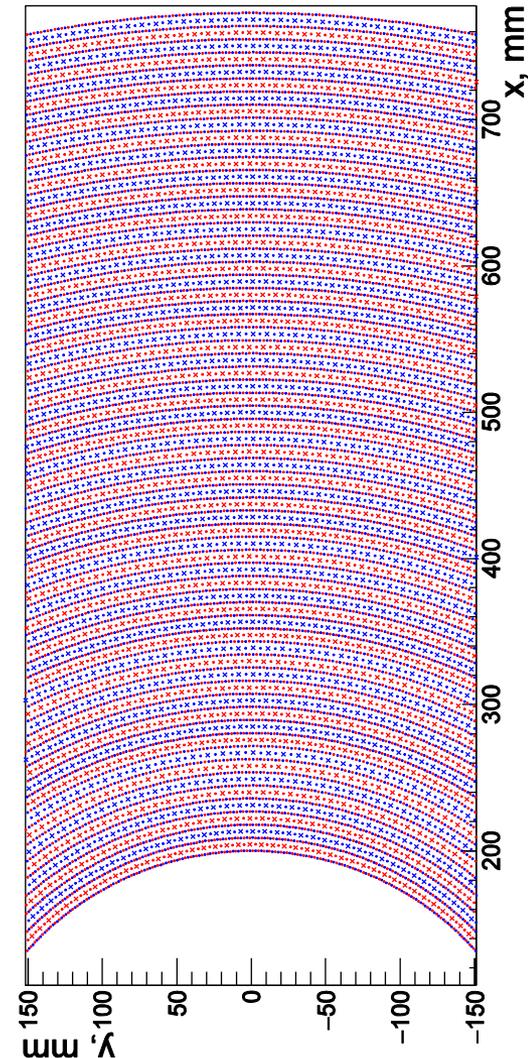

$$\approx 0.2\% \text{ at } 1 \text{ GeV}$$

$$\frac{\sigma_{dN/dx}}{dN/dx} \approx 3.6\%$$

With room for improvement!

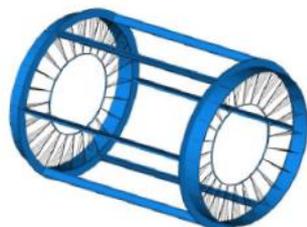

Measurement of individual clusters improves time and dE/dx resolution

# MEG-2 drift chamber

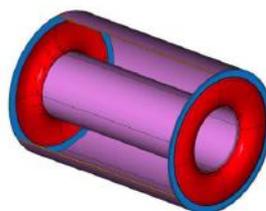

## The MEG2 drift chamber

- Separation of the wire anchoring function from the mechanical and wire containment

Wire support

Wire cage structure not subject to differential pressure can be light and feed-through-less.

Gas containment

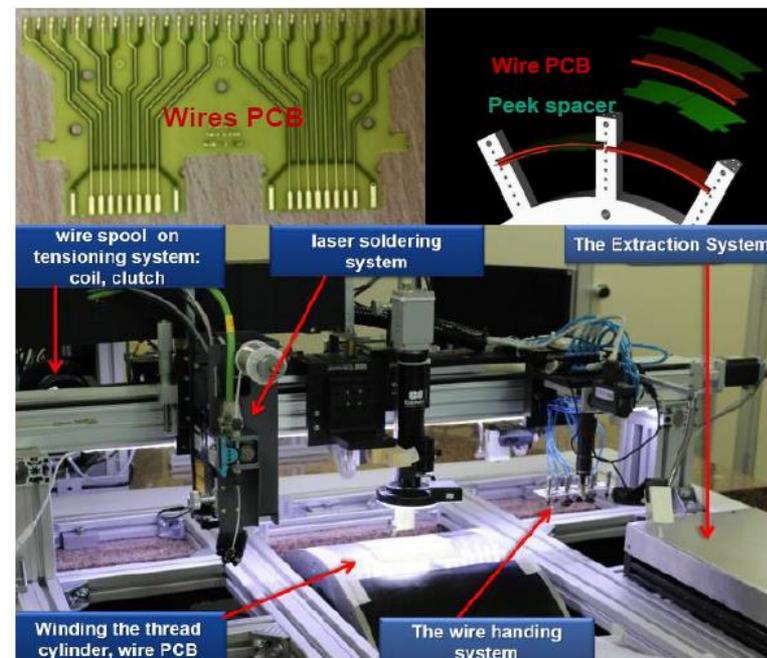

Gas envelope can freely deform without affecting the internal wire position and tension.

- Wire PCB

The high wires density ( $12 \text{ wires/cm}^2$ ) imposes the use of *wires PCBs* where the wires are accurately positioned and strung at the correct mechanical tension.

- Wiring robot

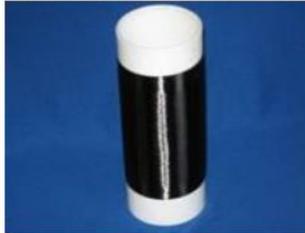

Stringent requirements on the precision of wire position and on the uniformity of the wire mechanical tension impose the use of an automatic system (Wiring Robot), to operate the wiring procedures.

# Варианты полевых проволок

Development of a new type of field and sense wires

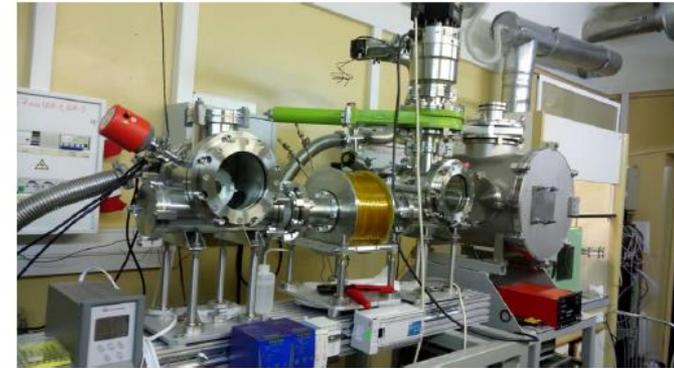

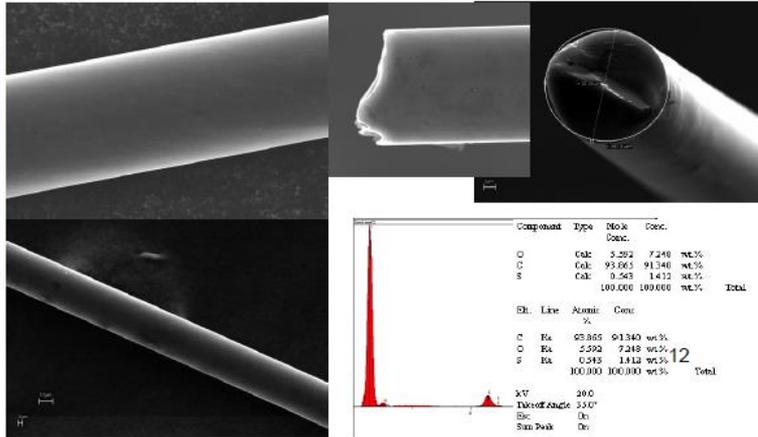

**SPECIALTY MATERIALS, INC.**  
Manufacturers of Boron and BCS Silicon Carbide Fibers and Boron-Nitrogen  
**CARBON MONOFILAMENT**

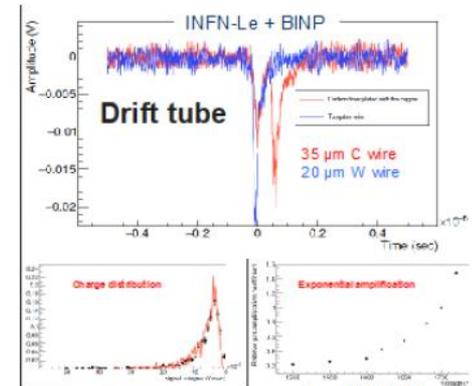

**TYPICAL PROPERTIES**

Diameter: 6.00136 +/- 0.0001" (34.5 +/- 2.5  $\mu\text{m}$ )  
Tensile Strength: 125 ksi (0.86 GPa)  
Tensile Modulus: 6 msi (41.5 GPa)  
Electrical Resistivity:  $3.6 \times 10^{-9}$  ohm cm  
Density: 1.8 g/cc

Specialty Materials, Inc.  
1449 Middlesex Street

Plan to create smaller-size DC for CMD-3 as a prototype

# Test beam at CERN

## Purpose

- **Demonstrate the ability to count clusters at a fixed  $\beta\gamma$  (e.g. muons at a fixed momentum – 165 GeV/c) by changing:**
  - the cell size (1 – 3 cm)
  - the track angle ( $0^\circ$  to  $60^\circ$ )
  - the gas mixture (90/10: 12 cl/cm, 80/20: 20 cl/cm, for m.i.p.)
- **Establish the limiting parameters for an efficient cluster counting:**
  - cluster density as a function of impact parameter
  - space charge (by changing gas gain, sense wire diameter, track angle)
  - gas gain stability
- **Train different cluster counting algorithms**

## Requirements for PID system

- $\pi/K$  separation  $> 4\sigma$  up to 2.5-3.5 GeV/c
  - TOF (BES-3):  $3\sigma$  at 0.9 GeV/c, DIRC (BaBar):  $4\sigma$  at 2.5 GeV/c
  - ASHIPH (KEDR):  $4\sigma$  at 1.5 GeV/c
- $\mu/\pi$  suppression  $< 1/40$  for to 0.5-1.2 GeV/c
- good  $\mu/\pi$  separation at low momentum

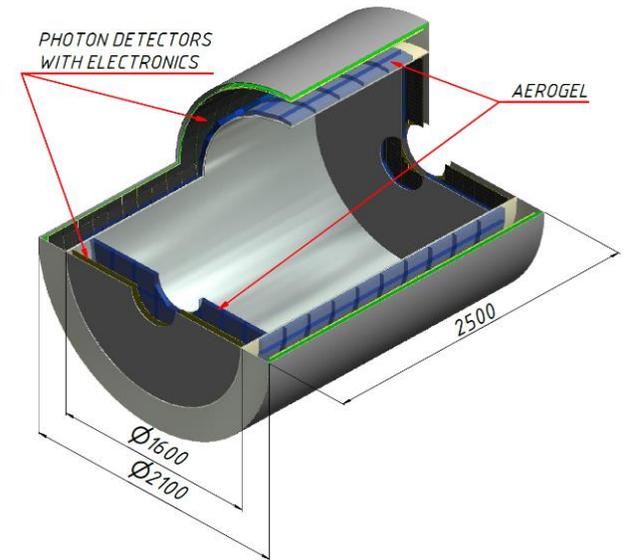

Several option are being considered:

FARICH, ASHIPH, TOF, FDIRC

# PID: FARICH option (BINP)

Variable  $n$  allows to increase  $N_{pe}$  using thicker radiator without compromising  $\sigma_{\Theta C}$

T.Iijima et al., NIM A548 (2005) 383

A.Yu.Barnyakov et al., NIM A553 (2005) 70

A.Yu. Barnyakov, et al., NIM A 732 (2013) 35

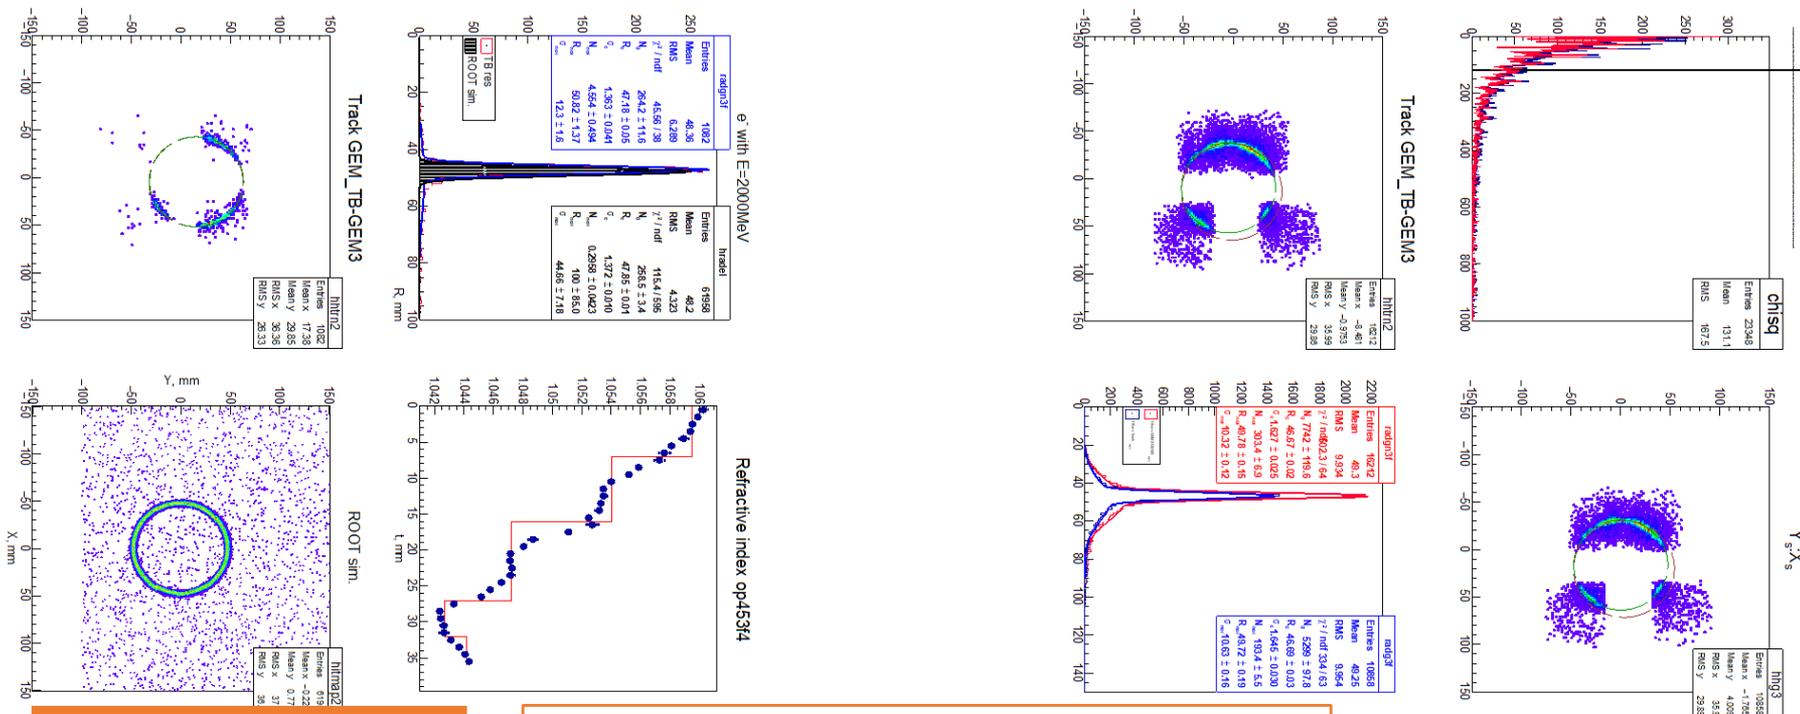

First detector: Belle-II (ARICH)

- Proximity focusing RICH
- 4-layer or gradient aerogel radiator  $n_{max} = 1.05$  (1.07?), thickness 35 mm
- **21 m<sup>2</sup>** total photon detector area
  - SiPMs in barrel (16 m<sup>2</sup>)
  - MCP PMTs in endcaps (5 m<sup>2</sup>)
- $\sim 10^6$  pixels with 4 mm pitch

2012 test beam:  $\mu/\pi$  separation  $\geq 3\sigma$  at  $P=1$  GeV/c is demonstrated

# FARICH beam tests (2021)

Pixel  $\phi$  1 mm  
 $\sigma_R = 1.36 \pm 0.04 \text{ mm}$

Beam test results in May-Dec of 2021 show us that we are very close to target resolution  
 $\sigma_R(\blacksquare 3 \text{ mm}) = 1.4 \text{ mm}$  (from G4 simulation)

Pixel  $\blacksquare$  3 mm  
 $\sigma_R = 1.63 \pm 0.03 \text{ mm}$

$$\sigma_R^{calc}(\blacksquare 3 \text{ mm}) = \sqrt{1.36^2 + \left(\frac{3}{\sqrt{12}}\right)^2} = 1.613 \text{ mm}$$

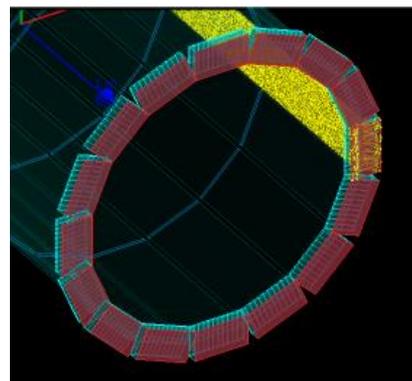

# PID: FDIRC options (JLU, Giessen)

## FDIRC option

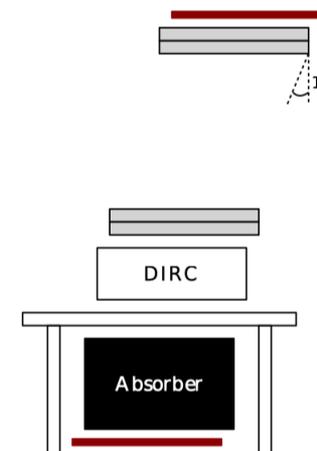

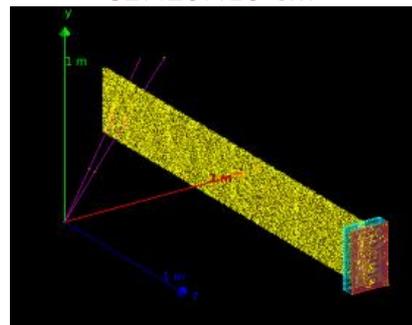

- Inspired by design from BaBar, SuperB, Belle II, and PANDA
- For PANDA  $\sigma_{\Theta_c} \approx 2.1$  mrad/track is achieved for  $\pi/K$  with  $3\sigma@4$  GeV/c
- For SCTF  $\sigma_{\Theta_c} \approx 0.7$  mrad/track is required for  $\mu/\pi$  with  $3\sigma@1.5$  GeV/c

### Main parameters:

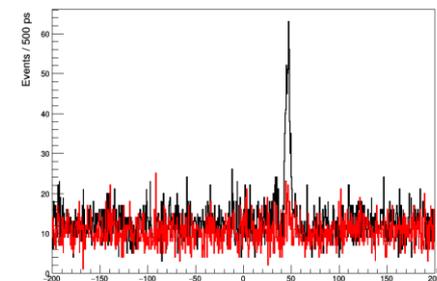

- ▶ Synthetic fused silica:
  - Barrel:**  $2 \times 16$  plates  $110 \times 32 \times 1.5$  cm
  - Endcap:**  $2 \times 4$  sectors  $1 \div 2$  cm thick
- ▶ Focusing optics: innovative rad-hard 3-layer spherical lens
- ▶ MCP-PMT or SiPM with  $\sigma_t \leq 100$  ps
  - Barrel:**
    - ▶  $2 \div 3$  mm pixel
    - ▶  $2.56 \div 1.14 \cdot 10^5$  readout channels
  - Endcap:**
    - ▶  $16 \times 0.5$  mm pixel
    - ▶  $2.88 \cdot 10^4$  readout channels

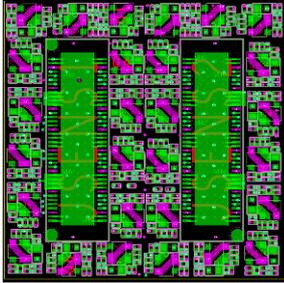

$2 \times 16$  plates  $110 \times 32 \times 1.5$  cm<sup>3</sup>  
and  $2 \times 16$  expansion volumes  
 $32 \times 20 \times 10$  cm<sup>3</sup>

Giessen cosmic station (GCS)

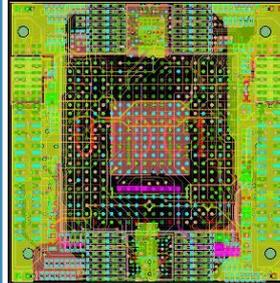

# Compact FEE for FARICH/DIRC

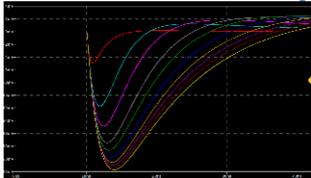

## Amplifier board

- 27×27 mm<sup>2</sup> size
- 14-layer PCB
- 30x gain, 64 channels
- couples to KETEK 8×8 SiPM array

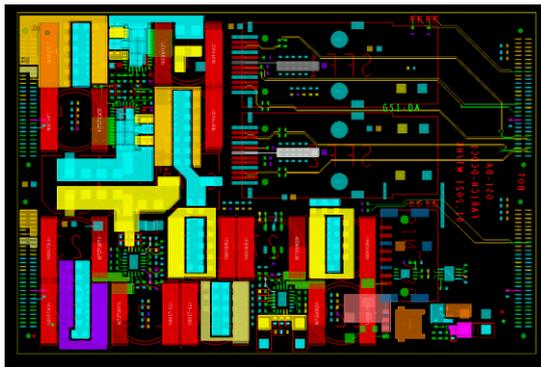

## TDC board

- 64 channels
- 2 TDC + 4 threshold FPGAs
- 10ps precision

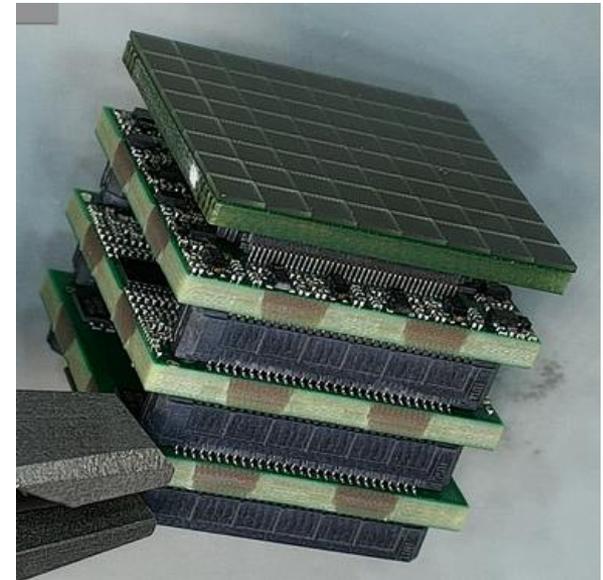

Simulated single photon pulse shapes from amplifier for different input resistance. ~ 22mV amplitude can be achieved.

## DC-DC converter board

- goes behind the backplane
- 51×84 mm<sup>2</sup> size
- provides power to SiPMs, amplifiers, FPGA
- uses air inductive coils to operate in the detector magnetic field
- power, trigger & clock connectors

# Calorimeter

## Baseline:

BELLE/BELLE-2-like electromagnetic crystal calorimeter

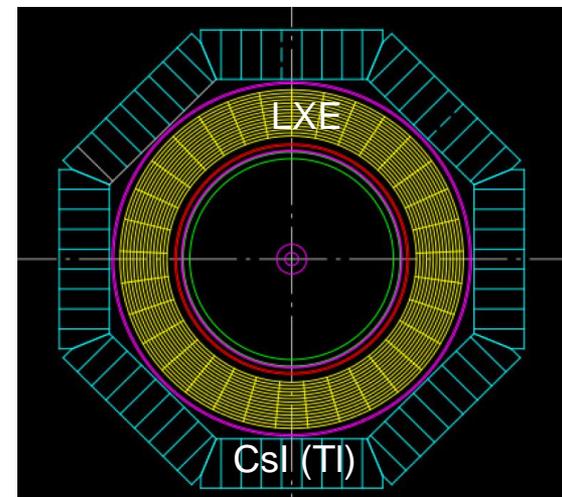

## Scintillator:

CsI(Tl) has large light yeild, “cheap”, very popular – but slow  
LSO, LYSO, etc. – have large LY, very fast – but very expensive  
(x10)

**pure CsI – good compromise: reasonable LY,  
30 ns component, reasonable price**

## Other options being considered:

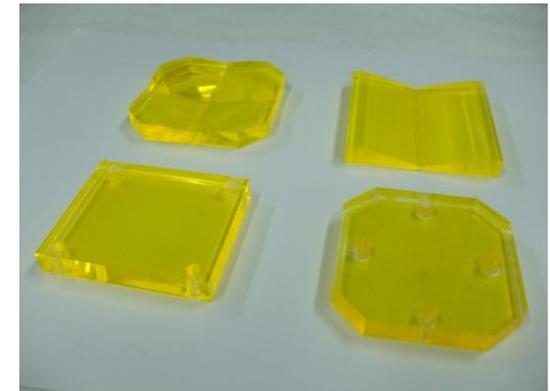

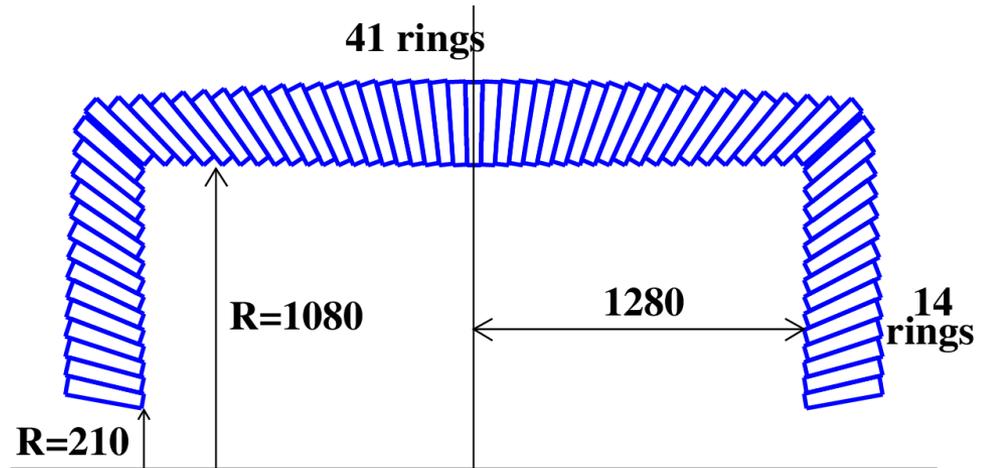

LXe calorimeter, combined LXe + crystal  
calorimeter (CMD-3: LXe+CsI(Tl))

CMD-3 calorimeter

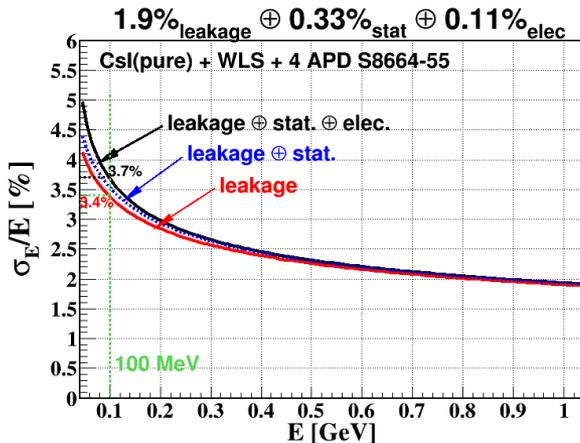

# Calorimeter: pCsl option

- 7424 crystals, 16/18  $X_0$   
5248 in barrel  
2176 in endcap
- 5.5 x 5.5 x 30(34) cm
- **I. pCsl + 1 photopentode**
- **II. pCsl + WLS + 4 APD**

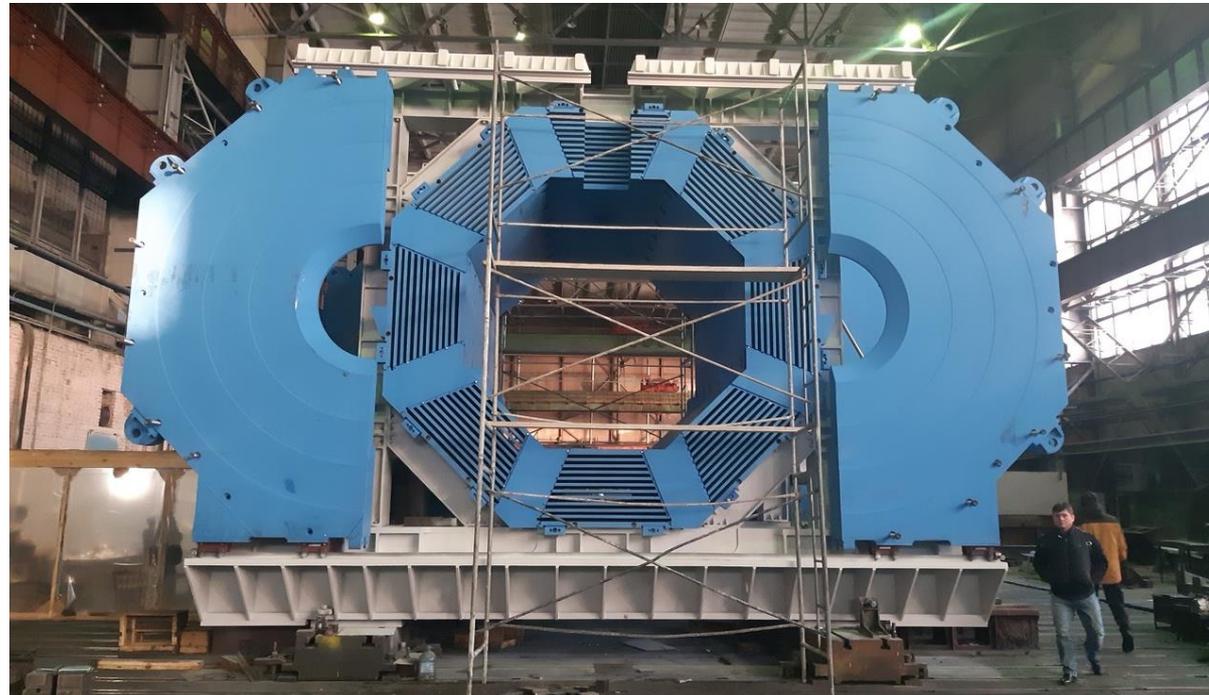

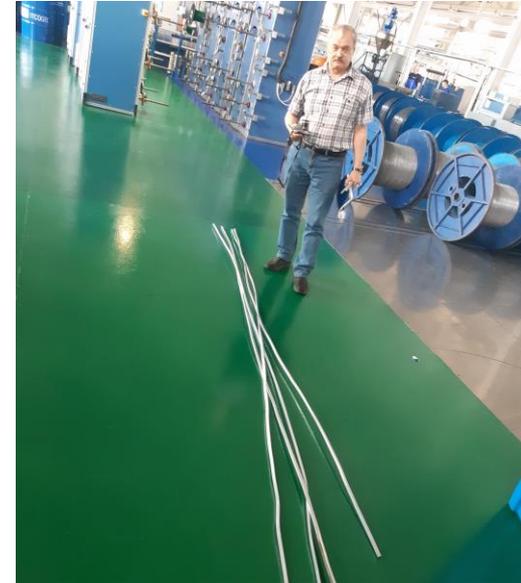

**Option (I)** was tested successfully ~18 years ago, project parameters were achieved. Option (II) is being prototyped and optimized, still notable improvements are necessary.

$$\frac{\sigma_E}{E} \approx \frac{1.7\%}{\sqrt[4]{E(\text{GeV})}} \oplus \frac{0.33\%}{\sqrt{E}} \oplus \frac{0.11\%}{E}$$

# Magnet

- BINP is now building SC magnet for PANDA detector
  - Yoke is finished
  - Technology for cable production is being developed (in Russia)
- SCTF magnet is very similar in size and design

# Muon system

- detect muons
  - mult.scat. of  $O(1\text{cm})$
- $\mu/\pi$  separation
- $K_L$  detection

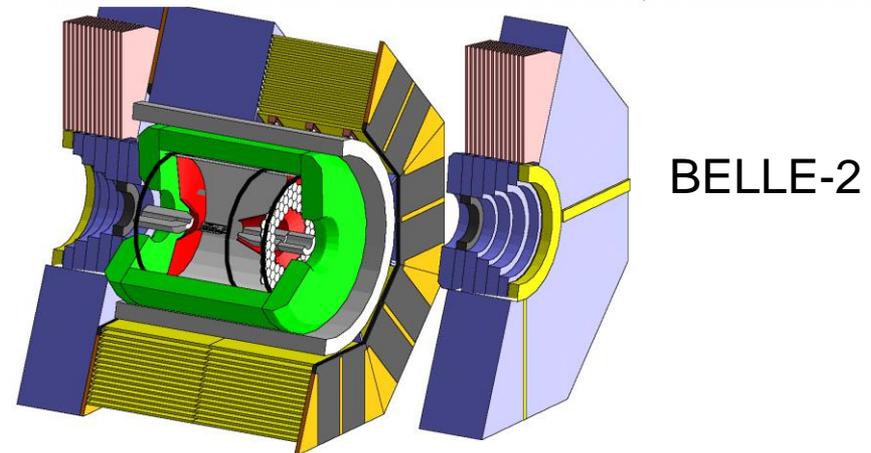

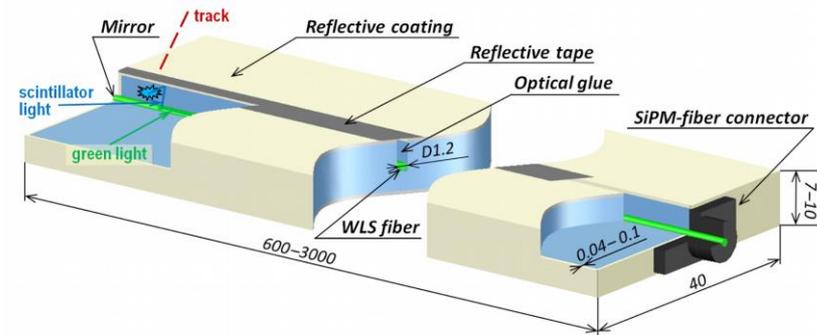

## Baseline option:

scintillator strips + WLS fiber + SiPM

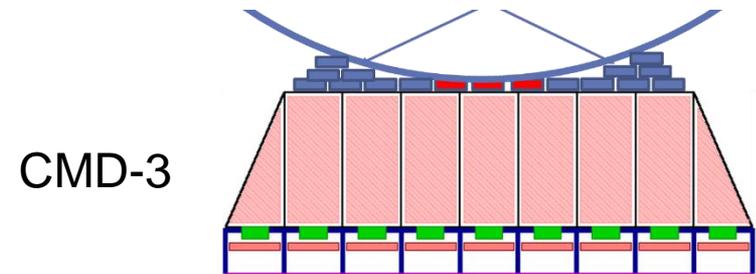

(BELLE-2, CMD-3)

8-9 layers inside iron yoke

$\sim 1500\text{ m}^2$

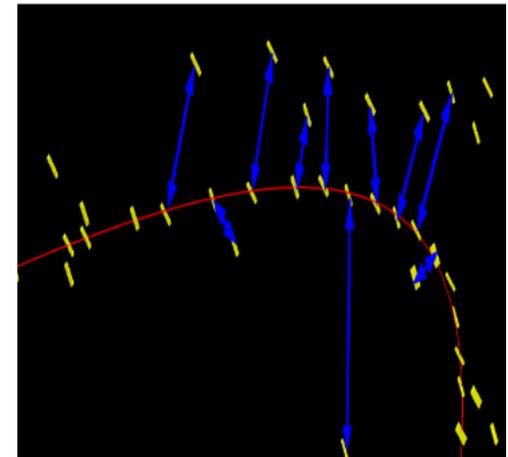

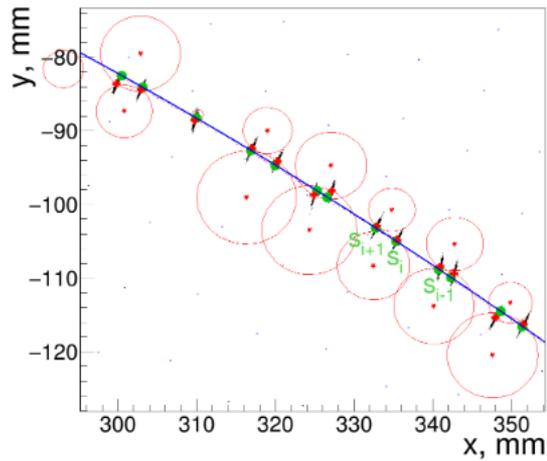

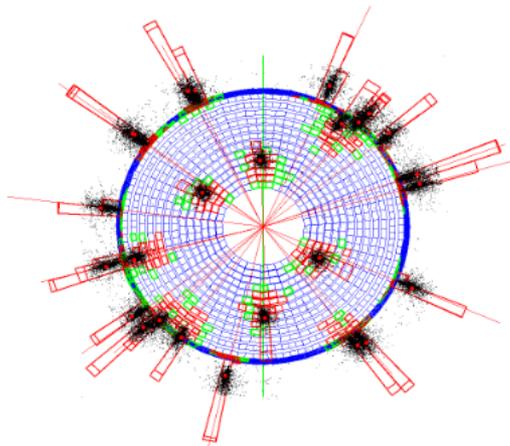

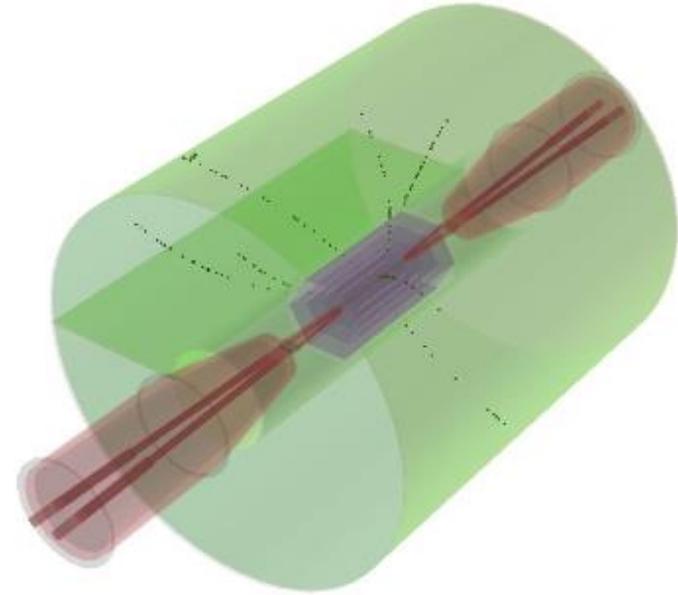

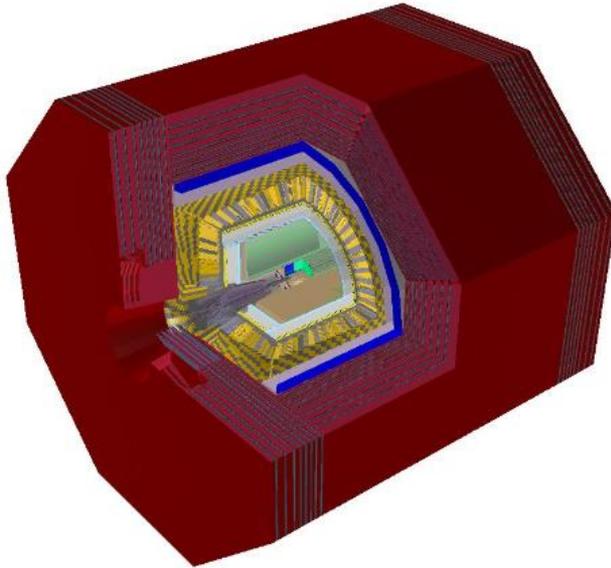

BELLE-2

CMD-3

# Моделирование

# ПО моделирования

## «Полное» моделирование

используем эффективную модель

## «Параметрическое» моделирование

Разработано ПО для параметрического моделирования всего детектора и полного моделирования ЦДК, калориметра, мюонной системы (частично – внутреннего трекера и системы идентификации)

# Детектор: от CDR к TDR

- Есть четкий план развития некоторых подсистем
  - Внутренний трекер: две опции
  - Центральная дрейфовая камера: две опции
  - Система идентификации: две опции
  - Сверхпроводящий магнит
  - Мюонная система
  - **Скорость разработки ограничена количеством людей и наличием ресурсов**
- Есть интересные идеи, но нет ресурсов для их разработки
  - Комбинированный калориметр
  - Внутренний трекер на полупроводниковых сенсорах
  - Дополнительные варианты системы идентификации
  - **Нет людей для разработки этих идей**
- Совсем не проработаны некоторые системы
  - ASIC-и для предварительной электроники
  - Электроника сбора данных
  - Online компьютеринг
  - **Нет людей и недостаточно существующих компетенций**

# Вместо заключения

Проект Супер с-тау фабрики активно развивается

- Ускорительный проект
  - Есть концептуальный проект
  - Текущая задача: достижение проектных параметров с учетом нелинейной динамики (final focus)
  - Синергия с FCC-ee и Super KEKB
- Детектор
  - Есть концептуальный проект
  - По основным системам ведется прототипирование и детальное проектирование опций, развивается полное моделирование систем
  - Сложилась и расширяется коллаборация
- Физическая программа
  - Есть детальный концептуальный проект (физическая программа)
  - Расширяется детальное моделирование отдельных процессов, цель - Physics book в 2023
  - Расширяется круг людей, вовлеченных в обсуждение физической программы (международные совещания, Партнерство, Snowmass,...)
- Финансирование
  - Строительство Супер с-тау фабрики активно обсуждается в рамках программы развития НЦФМ (г.Саров)
